

Diagram:

Flow Dig:-

connect databse (create user,database,table)

- run main.go
- server starts. Which ready to handle requests and give response.
- Request from user hits to server which goes to chi router to interface , methods ,interface repository to database (user,database then table).
- If request gives any error the error message will reflected back agin to user at any stage.The error backs from that stage beacause of exception and error handlers.
- If request succeeds then Acknowledge.
- Same procedure for response.
